

**IN THE CLAIMS:**

Please amend claims 1, 4, 8, 26, 29 and cancel 7 and 28 without prejudice or disclaimer. This listing of claims will replace all prior versions, and listings, of claims in the application.

**Listing of Claims:**

Claim 1 (Currently Amended): A backlight device for a liquid crystal display, comprising:

a light-guiding plate disposed at a rear of a liquid crystal display panel of the liquid crystal display;

a common substrate parallel to the light-guiding plate; a plurality of white, red, green, and blue light emitting diodes arranged on the common substrate; and

a housing to concentrate white, red, green, and blue lights emitted from the plurality of light emitting diodes along one direction, wherein the common substrate is disposed at a rear of the housing,

wherein the plurality of white, red, green, and blue light emitting diodes are sequentially disposed in an order of white, red, green, and blue, and each of the plurality of light emitting diodes has a portion light-emitting portions disposed inside the housing and a portion body portions disposed outside the housing such that the housing surrounds the light-emitting portions of the plurality of light emitting diodes, and

wherein upper surface and one side surface of the light-emitting portions of the plurality of light emitting diodes are opposite to the housing, and other side surface of the

light-emitting portions of the plurality of light emitting diodes is opposite to a light-incidence surface of the light-guiding plate.

Claim 2 (Original): The device according to claim 1, wherein the white light emitting diodes are disposed between the blue and red light emitting diodes.

Claim 3 (Canceled).

Claim 4 (Currently Amended): A backlight device for a liquid crystal display, comprising:

a light-guiding plate disposed at a rear of a liquid crystal display panel of the liquid crystal display;

a common substrate parallel to the light-guiding plate;  
at least one light source disposed along one side of the light-guiding plate on the common substrate, the light source including a plurality of light emitting diodes in order of white, red, green, and blue;

a housing disposed adjacent to the light-guiding plate for concentrating white, red, green, and blue light emitted from the light source along a first light direction, wherein the common substrate is disposed at a rear of the housing; and

a reflecting plate disposed under the light-guiding plate for reflecting light leaking along a side of the liquid crystal display panel opposite to the light-guiding plate,  
wherein each of the plurality of light emitting diodes has a portion light-emitting portions disposed inside the housing and a portion body portions disposed outside the

housing such that the housing surrounds the light-emitting portions of the plurality of light emitting diodes, and

wherein upper surface and one side surface of the light-emitting portions of the plurality of light emitting diodes are opposite to the housing, and other side surface of the light-emitting portions of the plurality of light emitting diodes is opposite to a light-incidence surface of the light-guiding plate.

Claim 5(Withdrawn): The device according to claim 4, wherein the light sources are disposed along two opposing sides of the light-guiding plate.

Claim 6(Original): The device according to claim 4, wherein the housing includes aluminum.

Claim 7(Canceled).

Claim 8(Currently Amended): The device according to claim 74, wherein the housing is disposed between the light-emitting portions and the body portions of the plurality of light emitting diodes.

Claim 9(Withdrawn): A backlight device for a liquid crystal display, comprising:  
a main light-guiding plate disposed at a rear of a liquid crystal panel of the liquid crystal display;

at least one sub light-guiding plate disposed adjacent to an incident surface along one side of the main light-guiding plate;

at least one light source disposed along one side of the sub light-guiding plate, the light source includes a plurality of light emitting diodes in order of white, red, green, and blue;

a housing adjacent to the light-guiding plate for concentrating white, red, green, and blue light emitted from the light source along a first light direction; and

first and second reflecting plates disposed under the main light-guiding plate for reflecting light leaking along a side of the liquid crystal display panel opposite to the main light-guiding plate and the sub light-guiding plate.

Claim 10(Withdrawn): The device according to claim 9, wherein the second reflecting plate includes aluminum coated with silver.

Claim 11(Withdrawn): The device according to claim 9, wherein the sub light-guiding plate is disposed between the housing and the first and second reflecting plates.

Claim 12(Withdrawn): A backlight device for a liquid crystal display, comprising:  
a first light source including a plurality of green, blue, and red light emitting diodes disposed on a substrate according to a first arrangement order along a first row direction; and  
a second light source including a plurality of white light emitting diodes disposed on the substrate according to a second arrangement order along a second row direction,  
wherein the first row direction is different from the second row direction.

Claim 13 (Withdrawn): The device according to claim 12, wherein the first arrangement order includes a first periodic repeating order of the green, blue, and red light emitting diodes along the first row direction.

Claim 14(Withdrawn): The device according claim 12, wherein each of the white diodes are disposed between each of the green and blue light emitting diodes, between each of the red and green light emitting diodes, and between each of the blue and green light emitting diodes.

Claim 15(Withdrawn): A backlight device for a liquid crystal display, comprising:  
a light-guiding plate disposed at a rear of a liquid crystal display panel of the liquid crystal display;

a first light source disposed along at least one side of the light-guiding plate, the first light source includes a plurality of green, blue, and red light emitting diodes arranged along a first row direction;

a second light source disposed along at least the one side of the light-guiding plate, the second light source includes a plurality of white light emitting diodes arranged along a second row direction different from the first row direction;

a housing affixing the first and second light sources and concentrating light emitted from the first and second light sources along a first light direction; and

a reflecting plate disposed under the light-guiding plate for reflecting light leaking along a side of the liquid crystal display panel opposite to the light-guiding plate.

Claim 16(Withdrawn): The device according to claim 15, wherein the first and second light sources are formed on a single substrate.

Claim 17(Withdrawn): The device according to claim 15, wherein the housing includes aluminum.

Claim 18(Withdrawn): The device according to claim 15, wherein the first and second light sources are each formed along both sides of the light-guiding plate.

Claim 19(Withdrawn): The device according to claim 15, wherein the plurality of green, blue, and red light emitting diodes are arranged in a periodic repeating order of green, blue, and red along the first row direction.

Claim 20(Withdrawn): The device according to claim 15, wherein each of the white light emitting diodes are arranged in a periodic repeating order between each of the green and blue light emitting diodes, between each of the red and green light emitting diodes, and between each of the blue and green light emitting diodes.

Claim 21(Withdrawn): A backlight device for a liquid crystal display, comprising:  
a main light-guiding plate disposed at a rear of a liquid crystal display panel of the liquid crystal display;  
a sub light-guiding plate disposed on an incident surface along one side of the main light-guiding plate;

a first light source disposed along at least one side of the sub light-guiding plate, the first light source includes a first periodic repeating order of a plurality of green, blue, and red light emitting diodes along a first row direction;

a second light source disposed along at least the one side of the sub light-guiding plate, the second light source includes a second periodic repeating order of a plurality of white light emitting diodes along a second row direction different from the first row direction;

a housing adjacent to the main light-guiding plate affixing the first and second light sources and concentrating light emitted from the first and second light sources along a first light direction; and

first and second reflecting plates disposed under the main light-guiding plate for reflecting light leaking along a side of the liquid crystal display panel.

Claim 22(Withdrawn): The device according to claim 21, wherein the first and second light sources are bonded to a common substrate.

Claim 23(Withdrawn): The device according to claim 22, wherein the common substrate is disposed perpendicular to a major surface of the main light-guiding plate.

Claim 24(Withdrawn): The device according to claim 22, wherein the common substrate is disposed parallel to a major surface of the main light-guiding plate.

Claim 25(Withdrawn): The device according to claim 21, wherein the second reflecting plate includes aluminum Al coated with silver.

Claim 26(Currently Amended): A method of fabricating a backlight device for a liquid crystal display, comprising:

forming a light-guiding plate at a rear of a liquid crystal display panel of the liquid crystal display;

forming a common substrate parallel to the light-guiding plate;

forming at least one light source along one side of the light-guiding plate on the common substrate, the light source including a plurality of light emitting diodes in order of white, red, green, and blue;

forming a housing adjacent to the light-guiding plate for concentrating white, red, green, and blue light emitted from the light source along a first light direction, wherein the common substrate is disposed at a rear of the housing; and

forming a reflecting plate under the light-guiding plate for reflecting light leaking along a side of the liquid crystal display panel opposite to the light-guiding plate.

wherein each of the plurality of light emitting diodes has a portion disposed inside the housing and a portion disposed outside the housing,

wherein each of the plurality of light emitting diodes has a portion light-emitting portions disposed inside the housing and a portion body portions disposed outside the housing such that the housing surrounds the light-emitting portions of the plurality of light emitting diodes, and

wherein upper surface and one side surface of the light-emitting portions of the plurality of light emitting diodes are opposite to the housing, and other side surface of the light-emitting portions of the plurality of light emitting diodes is opposite to a light-incidence surface of the light-guiding plate.

Claim 27(Withdrawn): The method according to claim 26, wherein the forming of at least one light source includes forming a plurality of the light sources along two opposing sides of the light-guiding plate.

Claim 28(Canceled).

Claim 29(Currently Amended): The method according to claim 2826, wherein the housing is disposed between the light-emitting portions and the body portions of the plurality of light emitting diodes.

Claim 30(Withdrawn): A method of fabricating a backlight device for a liquid crystal display, comprising:

forming a main light-guiding plate at a rear of a liquid crystal display panel of the liquid crystal display;

forming at least one sub light-guiding plate adjacent to an incident surface along one side of the main light-guiding plate;

forming at least one light source along one side of the sub light-guiding plate, the light source includes a plurality of light emitting diodes in order of white, red, green, and blue;

forming a housing along the main light-guiding plate for concentrating white, red, green, and blue light emitted from the light source along a first light direction; and

forming first and second reflecting plates under the main light-guiding plate for reflecting light leaking along a side of the liquid crystal display panel opposite to the main light-guiding plate and the sub light-guiding plate.

Claim 31(Withdrawn): The method according to claim 30, wherein the sub light-guiding plate is disposed between the housing and the first and second reflecting plates.

Claim 32(Withdrawn): A method of fabricating a backlight device for a liquid crystal display, comprising:

forming a first light source including a plurality of green, blue, and red light emitting diodes on a substrate according to a first arrangement order along a first row direction; and

forming a second light source including a plurality of white light emitting diodes on the substrate according to a second arrangement order along a second row direction, wherein the first row direction is different from the second row direction.

Claim 33(Withdrawn): The method according to claim 32, wherein the first arrangement order includes a first periodic repeating order of the green, blue, and red light emitting diodes along the first row direction.

Claim 34(Withdrawn): The method according to claim 32, wherein each of the white diodes are disposed between each of the green and blue light emitting diodes, between each of the red and green light emitting diodes, and between each of the blue and green light emitting diodes.

Claim 35(Withdrawn): A method of fabricating a backlight device for a liquid crystal display, comprising:

forming a light-guiding plate at a rear of a liquid crystal display panel of the liquid crystal display;

forming a first light source along at least one side of the light-guiding plate, the first light source includes a plurality of green, blue, and red light emitting diodes arranged along a first row direction;

forming a second light source along at least the one side of the light-guiding plate, the second light source includes a plurality of white light emitting diodes arranged along a second row direction different from the first row direction;

forming a housing adjacent to the light-guiding plate for affixing the first and second light sources and concentrating light emitted from the first and second light sources along a first light direction; and

forming a reflecting plate under the light-guiding plate for reflecting light leaking along a side of the liquid crystal display panel opposite to the light-guiding plate.

Claim 36(Withdrawn): The method according to claim 35, wherein the first and second light sources are formed on a single substrate.

Claim 37(Withdrawn): The method according to claim 35, wherein the first and second light sources are each formed along both sides of the light-guiding plate.

Claim 38(Withdrawn): The method according to claim 35, wherein the plurality of green, blue, and red light emitting diodes are arranged in a periodic repeating order of green, blue, and red along the first row direction.

Claim 39(Withdrawn): The method according to claim 35, wherein each of the white light emitting diodes are arranged in a periodic repeating order between each of the green and blue light emitting diodes, between each of the red and green light emitting diodes, and between each of the blue and green light emitting diodes.

Claim 40(Withdrawn): A method of fabricating a backlight device for a liquid crystal display, comprising:

forming a main light-guiding plate at a rear of a liquid crystal display panel of the liquid crystal display;

forming a sub light-guiding plate on an incident surface along one side of the main light-guiding plate;

forming a first light source along at least one side of the sub light-guiding plate, the first light source includes a first periodic repeating order of a plurality of green, blue, and red light emitting diodes along a first row direction;

forming a second light source along at least the one side of the sub light-guiding plate, the second light source includes a second periodic repeating order of a plurality of white light emitting diodes along a second row direction different from the first row direction;

forming a housing adjacent to the main light-guiding plate for affixing the first and second light sources and concentrating light emitted from the first and second light sources along a first light direction; and

forming first and second reflecting plates under the main light-guiding plate for reflecting light leaking along a side of the liquid crystal display panel.

Claim 41 (Canceled).

Claim 42(Withdrawn): The method according to claim 40, wherein the first and second light sources are bonded to a common substrate.

Claim 43(Withdrawn): The method according to claim 42, wherein the common substrate is disposed perpendicular to a major surface of the main light-guiding plate.

Claim 44(Withdrawn): The method according to claim 42, wherein the common substrate is disposed parallel to a major surface of the main light-guiding plate.
